COMPLETEVIEW APP QUICKSTART

## COMPLETEVIEW 5.X AND NEWER

SALIENT

CompleteView App QuickStart

Use the following information to configure CompleteView, download, and begin using the CompleteView app.

Prerequisites & Configuration

- CompleteView version 5.5 or newer
- An Apple® device running iOS™ version 13 or newer

While CompleteView's embedded HTTP web server is enabled by default, Salient Systems recommends utilizing the embedded secured HTTPS web server whenever possible. Logged in as an administrator, select the Configure module, then navigate to Common Settings, Ports, and Web Services. Enable the Embedded Secure Webserver HTTPS, accept or modify the HTTPS Port, and Save the configuration. HTTPS requires a Security Certificate to be correctly signed by a signing authority to be secure. Consult the CompleteView 20/20 documentation for more information.

Installation and Logging On

From your Apple device, launch the App Store®. Search for CompleteView, and install the app.

After successfully installing the CompleteView app, launch it.

Enter the public IP address or hostname of the deployment's Management Server, port information (by default, port 8095 for HTTP and 8096 for HTTPS connections) and valid VMS or Active Directory credentials. If using HTTPS, select the Use TLS box. Optionally select Remember Me. Tap Log In to proceed.

Once logged in, select Settings and Help for more information.
